

I do not see the need for additional spectrum. I seriously doubt that there is any propagational advantage of 5 MHz over 4 or 10 MHz. We need to more efficiently manage our DX pile ups, contest operations and nets. Specifically we need to learn to "play nice with each other". Additional spectrum just allows us to avoid facing the issues. If we were to get additional spectrum I would prefer it be added to an existing allocation rather than a totally new one.

Thank you for your time, Richard Grant
